OIL-X EVOLUTION coalescing and dust removal filter elements incorporate a high efficiency drainage layer on the outside of the filter element.

The polyester needle felt material, used for the drainage layer (normally white/cream in colour) can on occasion discolour over time due to the materials used in its construction. This is completely normal for this type of material.

domnick hunter would like to confirm that discoloration of the material in no way affects the performance of the filter element or the elements ability to provide air quality in accordance with published ISO standards.

D.Mcmillan

Senior Engineering Manager
(Filter Elements and PCO2)

filtration purification separation
